

Yes. Before running InstallSoup.sh I would do this first:

1. Generate an SSH key on your Windows machine

In PowerShell:

```
1 ssh-keygen -t ed25519 -C "userName"
```

Accept the default location:

```
1 C:\Users\Editor\.ssh\id_ed25519
```

Verify:

```
1 Get-ChildItem $HOME\.ssh
```

You should now see:

```
1 id_ed25519
2 id_ed25519.pub
3 known_hosts
```

2. Install the public key on the server

Display the public key:

```
1 Get-Content $HOME\.ssh\id_ed25519.pub
```

Copy it.

Using the Hetzner console:

```
1 mkdir -p /home/userName/.ssh
2 chmod 700 /home/userName/.ssh
3
4 nano /home/userName/.ssh/authorized_keys
```

Paste the public key and save.

Then:

```
1 chmod 600 /home/userName/.ssh/authorized_keys
2 chown -R userName:userName /home/userName/.ssh
```

3. Verify SSH key login BEFORE Alma-Soup

From PowerShell:

```
1 ssh userName@46.62.143.174
```

If that succeeds, you're ready.

4. Then run Alma-Soup

```
1 cd Alma-Soup
2 dos2unix InstallSoup.sh ValidateSoup.sh
```

```
3
4  chmod +x InstallSoup.sh
5  chmod +x ValidateSoup.sh
6
7  bash -n InstallSoup.sh
8  bash -n ValidateSoup.sh
9
10 sudo ./InstallSoup.sh
```

So the very first thing I'd do on the rebuilt server is **create and verify SSH key-based login before running the bootstrap**.
